

Preventative Maintenance for Poly IBC's:

1. Inspect the container for visual damage. If the bottle has any cracks or dents it may be unsafe to reuse. Remove from service and replace if necessary. The bottle cannot be repaired if used in hazardous service.
2. Inspect all lids and gaskets
3. Check the bottom discharge valve. It should have a secondary closure for shipping.
4. If the container has a frame, inspect it for damage, loose or broken wires and repair if necessary.
5. All poly IBC's need to be retested every 2.5 years per 49CFR.
